DeepL · Team administration

Designing clear feedback for uploading and removing a team logo

I wrote the file requirements, upload feedback, persistent settings state and removal confirmation for custom branding.

My role

Content designer for the custom-logo upload and removal state family

Worked with

Enterprise product, product design and engineering

Why it mattered

Admins needed to know which image would work, whether the upload succeeded and what state the rest of the team would see.

01 · The experience

Making file choice, validation and the saved state visible

File selected

[View larger](#)

The upload begins with a familiar system picker; the product then has to explain whether the selected file can be used.

02 · The problem

Admins needed to know which image would work, whether the upload succeeded and what state the rest of the team would see.

A file picker can confirm which file an admin chose, but it cannot confirm that the product accepted it. Size, format and aspect-ratio rules belong to the product experience, as do the success and removal states that follow.

The setting also needed to preserve an existing logo when a replacement failed. Without distinct feedback, an admin could leave the page unsure whether the new image, the old image or no image would appear to the team.

Constraint

The setting lived on a long administration page, used the operating system file picker and had to recover cleanly from an oversized image without losing the existing logo.

03 · The language turn

Separate file selection from product state

BEFORE

Choose a file

AFTER

Choose · validate · preserve the current state on error · confirm upload · expose replace and remove actions

- 01

Put requirements before selection
Accepted formats, maximum size and aspect ratio appear beside the upload action, where they can prevent a failed attempt.
- 02

Keep selection and acceptance distinct
The file picker shows the chosen object; product feedback says whether that object became the team logo.
- 03

Preserve a usable fallback
An oversized replacement produces an error while the current settings state remains intact.
- 04

Show the saved state and available actions
After upload, the settings page displays the logo and offers explicit Upload and Remove actions; removal receives its own confirmation.
- The trade-off:** A lightweight upload control is faster to scan, but admins still need enough persistent context to predict the result of replacing or removing shared branding.

O5 - The sequence

From a local file to a confirmed team-branding state

01	02	03	04	05
Choose Select the intended logo with the file name visible.	Validate Reject an oversized image with the limit stated in the error.	Confirm upload Show that the logo was accepted and render it in the saved settings state.	Replace or remove Keep the current logo visible while exposing the two next administrative actions.	Confirm removal Return to the empty state and acknowledge that the shared logo was removed.

O6 - The complete source

Every export from the custom-logo source flow

File-picker state - 01

07 - The outcome

What the work made possible

The state family makes the administrative result inspectable: which file was chosen, why one failed, which logo is active and whether removal succeeded.
