DeepL · Pricing evolution

Simplifying pricing across four products

When DeepL Write Pro launched, pricing had to explain separate products, bundles and plan tiers at once. I worked on the content as the offer evolved toward one page per product, clearer add-on choices and cumulative tier descriptions.

My role	Worked with	Why it mattered
UX copywriter and content designer for pricing and feature awareness	UX writing, product marketing, design and product stakeholders	People needed to understand which product they were buying, what each tier added and whether Write Pro was included or available as an add-on.

The pricing system

One product page per product, with cumulative tiers

Translator pricing

[View larger](#)

The Translator page makes the tier progression visible by describing each plan as an addition to the one before it.

The problem

Act 1: Pricing was simple because the product was

At the start of 2023, DeepL pricing centered on one Translator grid with Starter, Advanced and Ultimate tiers. API pricing followed a separate path, while DeepL Write was free.

When Write Pro launched in 2024, that simple structure expanded into separate Translator and Write Pro offers plus bundles that combined them. The content had to distinguish products, plans and bundles without using Pro as an imprecise umbrella term.

Constraint	No conversion or revenue result is attributed to this pricing or feature-awareness work.

Key content decisions

Four decisions that reduced repetition across the product family

Name the commercial choice precisely

The language separates products, plan tiers, bundles and add-ons so each choice says what a customer is buying.

Show only what each tier adds

Cumulative descriptions replace repeated feature blocks with an explicit progression from one tier

to the next.

Keep buying information together

Prices, billing detail, discounts and actions stay in the price block instead of appearing as feature bullets.

Use one pattern across the family

Translator, Write and API use cumulative tiers where they fit, while the two Voice offers remain parallel use cases rather than artificial tiers.

The trade-off: Cumulative descriptions make tier differences more concise, but they require readers to follow the plan hierarchy. Clear tier names and a consistent Everything in... plus pattern keep that relationship visible.

Act 2 - Write Pro launch

Three grids and three ways to buy

At launch, people could choose Translator, Write Pro or a Translator + Write Pro bundle. Each route carried its own grid and vocabulary.

The three-tab selector brought Translator, Translator + Write and API together, while keeping the bundle as a distinct way to buy.

Translator pricing

View larger

The Translator grid keeps the free offer and four paid tiers in one comparison structure.

Write Pro pricing

View larger

The Write grid separates the free writing experience, the paid Write Pro offer and the sales-led business route.

Translator and Write Pro bundles

View larger

The bundle grid combines three Translator tiers with the same Write Pro feature set at each level.

Three-tab plan selector

View larger

The selector groups three ways to buy while naming the Translator + Write bundle as a distinct choice.

Act 2 - A simpler direction

Moving the Write Pro choice into the page

Later, I explored a simpler add-on direction. Instead of treating every Translator + Write combination as a separate route, the page let people add Write Pro with a toggle.

The bundle view makes the repeated Write Pro block visible; the Translator view shows the same page without the add-on. In both tables, qualifiers sit in the row label so each value is stated once.

Bundle grid with Write Pro

View larger

With the toggle on, each Translator tier adds the same Write Pro feature block, exposing the repetition created by the bundle model.

Bundle comparison table

Find the right plan

Unlimited everything	✓	✓	✓	✓

[View larger](#)

The comparison table places units and qualifiers in the row labels so the plan values remain short and easy to scan.

Translator grid without Write Pro

With the toggle off, the same structure presents Translator plans without repeating the Write Pro block.

Translator comparison table

[View larger](#)

The Translator table uses the same label-once pattern, keeping each row consistent with its bundle counterpart.

Act 3 · Four products

One page per product, with cumulative tiers

As Voice arrived and the product family expanded, the pricing structure separated Translator, Write, Voice and API into one page per product. Cumulative descriptions showed what each tier added, while add-ons and sales-led offers stayed distinct.

The pattern fits tiered products without forcing Voice for Meetings and Voice for Conversations into a tier comparison.

Translator pricing

Each Translator card names only what the tier adds, turning four repeated feature lists into one visible progression.

Write pricing

The Write page separates the free offer, the paid add-on, and the sales-led business tier without treating Write as another Translator plan.

Voice pricing

The Voice page presents Meetings and Conversations as parallel use cases, each with a direct route to Sales.

API pricing

The API page keeps the free entry point, usage-priced Pro offer and custom business route in one cumulative structure.

Feature awareness

Five paid capabilities in one scannable system

Pricing explained how to buy; feature-awareness modules explained why individual capabilities mattered. I wrote the five descriptions as a reusable set

with outcome-led headings, accurate qualifiers and varied sentence openings.

Feature-awareness system

View larger

The shared module keeps five product capabilities scannable while opening one concise explanation at a time.
