DeepL · Subscription checkout

Designing subscription checkout across trial and no-trial states

I wrote the sign-up, plan, billing, payment, consent and confirmation copy across trial, no-trial, bundle and team-purchase states.

My role

UX copywriter and content designer across sign-up, checkout and conditional subscription states

Worked with

Growth, product design, legal, localization and engineering

Why it mattered

Each route had to make the product, price, timing, eligibility and commitment accurate before the customer confirmed.

01 · The experience

Keeping each subscription promise accurate as the purchase state changed

Bundle checkout

[View larger](#)

The bundle state keeps both products, the combined price, trial timing and final commitment in one summary.

02 · The problem

Each route had to make the product, price, timing, eligibility and commitment accurate before the customer confirmed.

The purchase journey crossed sign-up and checkout. Sign-up needed to confirm the offer the customer had chosen; checkout needed to keep product, plan, seat count, billing cadence, payment timing and consent consistent with it.

A single variable could change the commercial promise. A no-trial account owed money immediately, a bundle included two products, and a team order multiplied price and entitlements by seat count.

Constraint

The same purchase structure had to account for product combinations, trial eligibility, seat count, billing cadence and customer type without losing the core decision.

03 · The language turn

Turn a fixed checkout into a conditional content system

BEFORE

AFTER

One generic purchase message

Carry the selected offer into sign-up, then update product, price, seats, trial timing, consent and confirmation together

04 - The judgment

The decisions doing the work

01 **Carry the offer into sign-up**

'Start my 30-day free trial' confirms the customer's selected offer while account creation remains the immediate action.

02 **Make the summary the source of truth**

Product, quantity, amount due today, later charge and billing cadence remain visible beside the final action.

03 **Treat eligibility as a content state**

Trial language, the due-today amount, activation timing, consent and reassurance change together when an account is ineligible.

04 **Keep variables consistent**

Bundle contents and seat count update the product names, totals, savings and included features as one linked state.

The trade-off: Reusing one structure keeps the route familiar; the content still has to make bundle, team and no-trial states materially different.

05 - The interface

How the language changes the experience

Sign-up continuity

[View larger](#)

Adding 'my' carries the selected trial into account creation without changing the button's immediate action: create the account.

Team purchase

[View larger](#)

The team state keeps 20 users consistent across the selector, order summary, savings and included allowances.

No-trial commitment

[View larger](#)

The ineligible state removes the trial promise, shows the full amount due today and adds the immediate-start acknowledgement.
