Marketing/editorial option 1 - Research report

Turning localization research into a clear business narrative

I structured survey findings from 415 senior marketers into a report on localization ROI, AI adoption and global content workflows.

My role

Writer and editor for the research narrative, structure, case studies and recommendations

Worked with

Marketing, research, design and subject-matter reviewers

Why it mattered

The report needed to turn a large survey into a useful argument for time-poor marketing leaders.

01 - The publication

Structuring a 17-page report from findings to recommendations

Report cover

[View larger](#)

The report frames the subject as a business question about the current state of localization—not a product brochure.

02 - The problem

The report needed to turn a large survey into a useful argument for time-poor marketing leaders.

The research contained plenty of usable statistics, but a sequence of charts would not explain why those findings belonged together. The editorial job was to turn the survey into a point of view for senior marketers responsible for multilingual growth.

The report also had to move between opportunity and friction: positive ROI and growing AI adoption on one side; terminology, integration and human-review challenges on the other. That tension became the spine of the story.

Constraint

The source material combined dozens of survey findings, four markets, multiple business sizes and two customer examples. The report had to surface patterns without flattening the evidence into one sweeping claim.

04 - The judgment

The decisions doing the work

01

Lead with the business case

The executive summary establishes customer engagement, ROI and adoption before asking readers to spend time on workflow problems.

02

Group findings into a narrative

Statistics are organized around a small set of reader questions—value, obstacles, technology choices and the continuing role of human review.

03	Use examples to make the research concrete HubSpot and Phrase turn abstract localization challenges into recognizable operating models.
04	End with an editorial payoff The recommendations translate the evidence into choices a marketing or localization leader can discuss with their team.
The trade-off: A report can preserve every caveat or maintain momentum. The structure keeps the important methodological limits while moving supporting detail out of the main argument.	

05	The report The argument moves from findings to action Executive summary  Recommendations 
06	The outcome What the work made possible The final report turned one survey into a coherent thought-leadership asset: a research narrative, practical recommendations and customer examples that could support several marketing formats.
